

IART - Artificial Intelligence

Exercise 3: Adversarial Search Problems

Luís Paulo Reis, Henrique Lopes Cardoso

LIACC – Artificial Intelligence and Computer Science Lab.

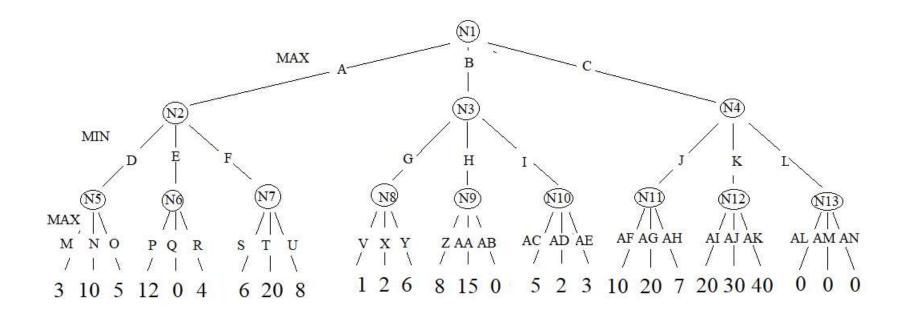

DEI/FEUP – Informatics Engineering Department, Faculty of Engineering of the

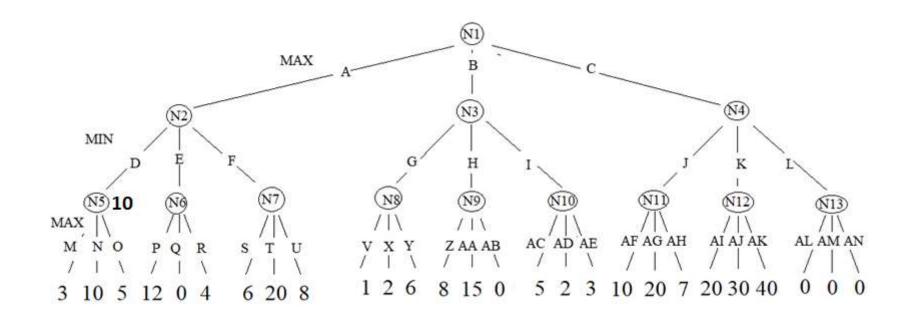

University of Porto, Portugal

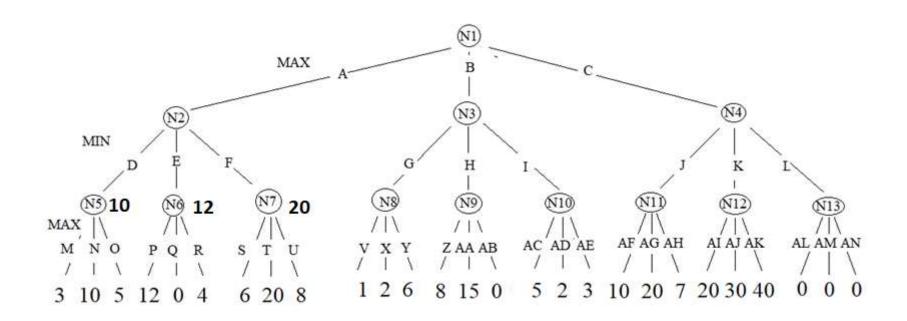

APPIA – Portuguese Association for Artificial Intelligence

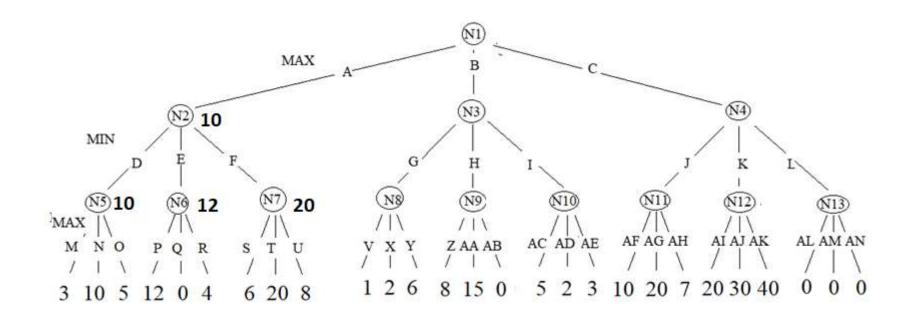

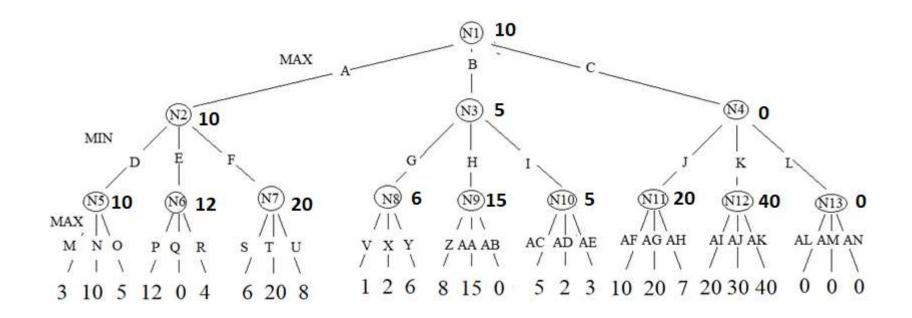

Apply the Minimax algorithm with alpha-beta cuts to the following tree that has a branch factor of 3 at the top level, 3 at the second level, and also 3 at the final level, and with the evaluation function values indicated for the final line. Indicate the final value of each node and which branches are cut by the Alpha-Beta cuts.

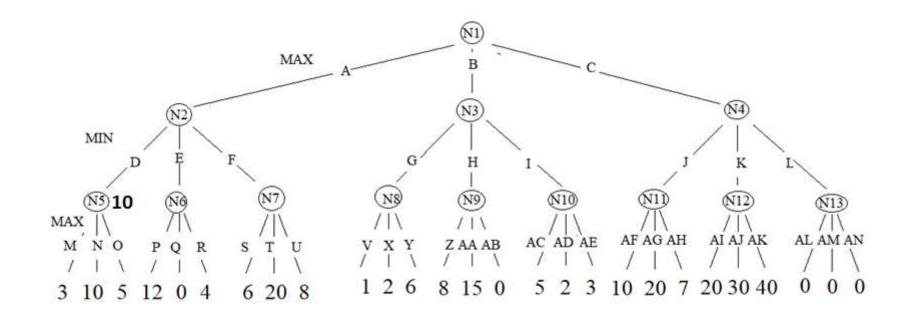

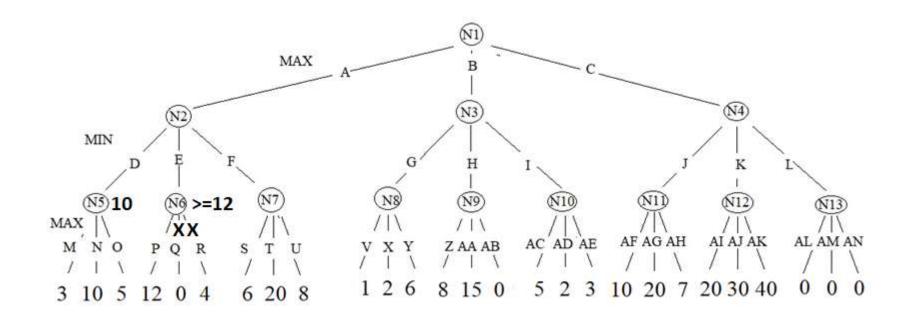

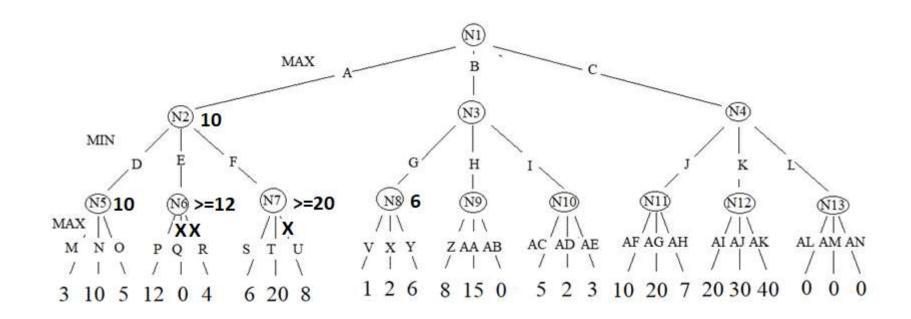

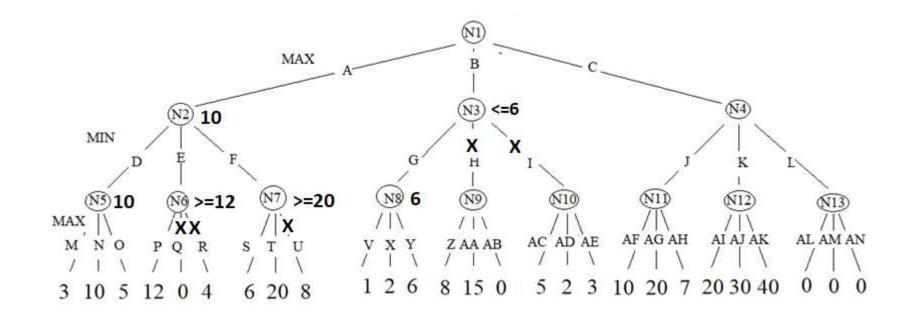

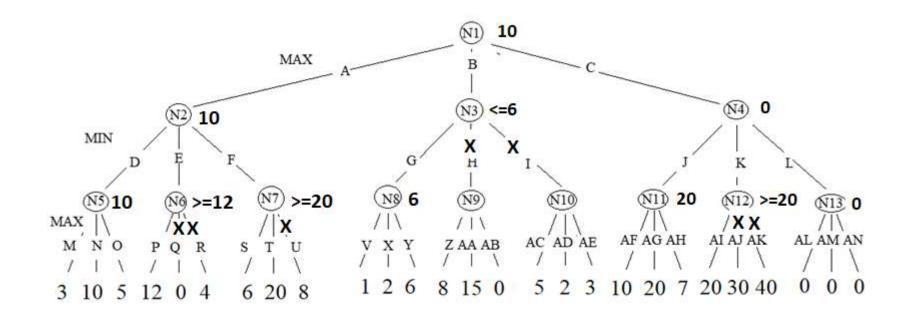

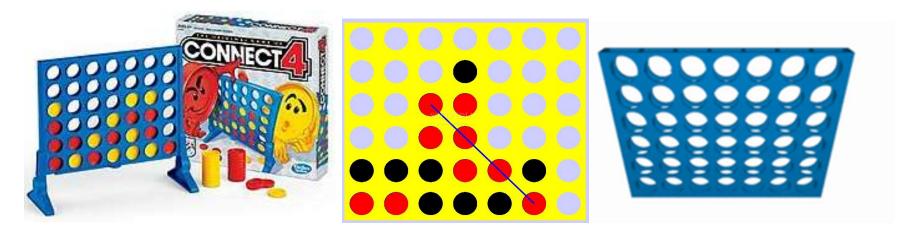

Exercise 3.2: Connect-4 Game

The game called "Connect Four" in the English language version ("4 em Linha" in the Portuguese version - https://en.wikipedia.org/wiki/Connect Four) is played on a vertical board of 7x6 squares (i.e., 7 squares wide and 6 squares high), by two players, to which are initially assigned 21 pieces to each.

The two players play alternately one of their pieces. The piece to be played is placed on the top of the board and slides either to the base of the board, or in a cell immediately above another one already occupied (see previous figure). The winner will be the player who manages to obtain a line of 4 pieces of its color/symbol horizontally, vertically, or diagonally. If the 42 pieces are played without any player getting a line, the final result will be a draw.

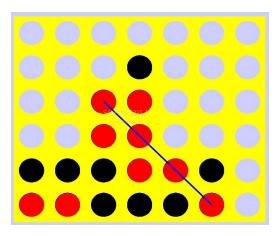

Connect-4 Game Implementation

- a) Formulate this game as a search problem with opponents, indicating the state representation, moves/operators (and respective names, preconditions, and effects), and the objective test.
- b) Implement a simple version of the "Connect-Four" game in a programming language of your choice.
- c) Implement the following functions:
 - c1) int nlines4 (int Player) that given the state of the board calculates the number of lines with 4 pieces (horizontal, vertical, diagonal) of a given player.
 - c2) int nlines3 (int Player), similar to the previous function, but which calculates the number of sets of 4 consecutive spots that have three pieces of the player followed by an empty spot, i.e., that are possibilities to win the game.
 - c3) int central (int Player), that assigns 2 points to each player piece in the center column of the board (column 4) and 1 point to each piece in the columns around it (columns 3 and 5).

Connect-4 Game Implementation

- d) Implement an agent to play the game using the minimax algorithm with alpha-beta cuts.
- e) Compare the results of the implemented agents, playing 10 matches of this game with each other, using the minimax algorithm with alpha-beta cuts, with levels (2, 4, 6 and 8), and the following evaluation functions:
 - Agent1: EvalF1 = nlines4(1) nlines4(2)
 - Agent2: EvalF2 = 100* EvalF1 + nlines3(1) nlines3(2)
 - Agent3: EvalF3 = 100* EvalF1 + central(1) central(2)
 - Agent4: EvalF4 = 5* EvalF2 + EvalF3
- Conclude about the effectiveness of each of the evaluation functions/agents and the effect of the depth used in the Minimax Algorithm.
- g) How could you improve the evaluation function for this type of agent?

- **State Representation:**
- **Initial State:**
- **Objective State:**
- **Operators:**

State Representation:

Matrix with Board: B[6,7], or in the general case B[N,M], filled with values 0..2 // 0 represents empty square, 1 and 2 pieces from player 1 or 2 Also the Player to move (Pla). Also it is a good idea to add to the last square played (YI, XI) for efficiency

Initial State:

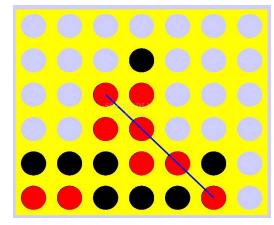

555

Objective State:

333

Operators:

555

State Representation:

Matrix with Board: B[6,7], or in the general case B[N,M], filled with values 0..2 // 0 represents empty square, 1 and 2 pieces from player 1 or 2

Also the Player to move (Pla). Also it is a good idea to add to the last square

played (YI, XI) for efficiency

Initial State:

 $B[6,7]={0}$ //Matriz B all with zeros (0) Pla = 1

Objective State:

555

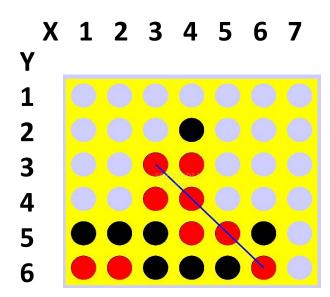

Operators:

333

State Representation:

```
Matrix with Board: B[6,7], or in the general
case B[N,M], filled with values 0..2
// 0 represents empty square, 1 and 2 pieces
from player 1 or 2
Player to move: Pla.
Also it is a good idea to add the last square
played (YI, XI) for efficiency
```

Initial State:

```
B[6,7]=\{0\}
               //Matriz B filled with zeros (0)
Pla = 1
               //Player 1 is the first to move
```

Objective State 0> Objective Test

```
// returns 0- draw, 1-Win for player 1, 2-Win for player 2, -1 – game not finished
int objective test(State B|Pla|Yl|Xl) {
    ... //Test lines in all directions from (Y1,X1)
```

         Operator Col) {
        return B[1,Col]==0;
    Effects:
    State exec move(State B|Pla|X1|Y1, Operator Col) {
        i = 6;
       while (B[i,Col]!=0) i--;
       B[i,Col] = Pla
       Pla = 3-Pla;
       Yl = i; Xl = Col;
        return B|Pla|X1|Y1;
```

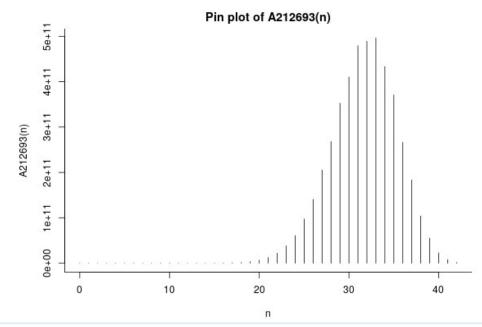

- What is the State Space Size for the Connect4 Game:
 - 6x7 Game?
 - Generic Case: NxM Game?
- What is the Maximum Branching Factor for the connect 4 Game:
 - 6x7 Game?
 - Generic Case: NxM Game?

- What is the State Space Size for the Connect4 Game:
 - 6x7 Game?
 - $3^{(6x7)} = 3^{42} = 1.09x10^{20}$?
 - Not completely since it includes a set of invalid states!
 - We need a better analysis!
- What is the Maximum Branching Factor for the connect 4 Game:
 - 6x7 Game?
 - Maximum Branching factor = 7 //7 columns
 - Generic Case: NxM Game?
 - Maximum Branching factor = M //Number of columns

- What is the State Space Size for the Connect4 Game:
 - 6x7 Game?
 - $3^{(6x7)} = 3^{42} = 1.09x10^{20}$?
 - Not really since it includes a set of invalid states:
 - States with floating pieces on top of empty spaces
 - States that may only be successors of states with already a line of 4 on the board (i.e. situations where the game was already ended)
 - States with difference between number of pieces 1 vs pieces 2 different from 0 and different from 1
- What is the Maximum Branching Factor for the connect 4 Game:
 - 6x7 Game?
 - Maximum Branching factor = 7 //7 columns
 - Generic Case: NxM Game?
 - Maximum Branching factor = M //Number of columns

- What is the State Space Size for the Connect4 Game:
 - 6x7 Game?
 - $3^{(6x7)} = 3^{42} = 1.09x10^{20}$?
 - Number of legal 6X7 Connect4 positions after n pieces:

$$-1 + 7 + 49 + 238 + 1120 + 4263 + 16422$$
, ... = 4531985219092
= 4.53×10^{13}

Connect-4 Game Implementation

- a) Formulate this game as a search problem with opponents, indicating the state representation, moves/operators (and respective names, preconditions, and effects), and the objective test.
- b) Implement a simple version of the "Connect-Four" game in a programming language of your choice.
- c) Implement the following functions:
 - c1) int nlines4 (int Player) that given the state of the board calculates the number of lines with 4 pieces (horizontal, vertical, diagonal) of a given player.

 - Agent3: EvalF3 = 100* EvalF1 + central(1) central(2)
 - Agent4: EvalF4 = 5* EvalF2 + EvalF3
- Conclude about the effectiveness of each of the evaluation functions/agents and the effect of the depth used in the Minimax Algorithm.
- g) How could you improve the evaluation function for this type of agent?

State and Operator/Move Representation

```
#define HEI 6
#define WID 7
struct state{
     int board[HEI][WID];
     int player;
     int lastMoveX, lastMoveY; //optional
                                  //optional
     int nmoves;
};
struct movem{
     int col;
};
```

Functions Needed for a Simple Game

```
void draw state(state st);
void init state(state &st);
movem get_pc_rand mov(state st);  //optional
movem get pc minimax mov(state st, int depth);
bool valid movement (state st, movem mov);
state execute movement (state st, movem mov);
int check winner(state st); //Objective Test
int evaluate(state st, int pl); //For minimax
```

Simple Game Engine

```
main() {
 state st; movem mov; srand(Time(NULL));
 init state(st);
 draw state(st);
 do {
    if (st.player==1) mov=get pc minimax mov(st);
        else mov=get human mov(st);
    st = execute movement(st, mov);
    draw state(st);
 } while (check winner(st) == -1);
 cout << "Winner:" << check winner(st) << endl;</pre>
```

Inititialization and Drawing

```
void init state(state &st) {
 for(int i=0; i<HEI; i++)
   for (int j=0; j < WID; j++)
     st.board[i][j]=0;
   st.nmoves=0; st.player=1; //st.player=2;
void draw state(state st)
  cout << "| 1 | 2 | 3 | 4 | 5 | 6 | 7 | " << endl;
   cout << "----
                                ----- << endl;
   for (int v=HEI-1; v>=0; y--) {
     for (int x=0; x<WID; x++) {
      if (st.board[y][x] == 0) cout << "| ";
      else if (st.board[y][x] == 1) cout << "| X ";
      else if (st.board[y][x] == 2) cout << "| 0 ";
      if (x==WID-1) cout << "|\n";
     cout << "----" << endl:
```

Inititialization and Drawing

```
void init state(state &st) {
 for(int i=0; i<HEI; i++)
   for (int j=0; j < WID; j++)
     st.board[i][j]=0;
   st.nmoves=0; st.player=1; //st.player=2;
void draw state(state st)
  cout << "| 1 | 2 | 3 | 4 | 5 | 6 | 7 | " << endl;
   cout << "----
                                ----- << endl;
   for (int v=HEI-1; v>=0; v--) {
     for (int x=0; x<WID; x++) {
      if (st.board[y][x] == 0) cout << "| ";
      else if (st.board[y][x] == 1) cout << "| X ";
      else if (st.board[y][x] == 2) cout << "| 0 ";
      if (x==WID-1) cout << "|\n";
     cout << "----" << endl:
```

Operators: Preconditions and Effects

```
bool valid movement (state st, movem mov)
   return (mov.col>=1 && mov.col<= WID &&
           st.board[HEI-1][mov.col-1]==0);
state execute movement (state st, movem mov)
   int i=0:
   while (st.board[i][mov.col-1] != 0) i++;
   st.board[i][mov.col-1]=st.player;
   st.lastMoveY = i; st.lastMoveX = mov.col-1;
   st.player= 3-st.player;
   st.nmoves++;
   return st;
```

Human and Random Moves

```
movem get human mov(state st) {
  movem mov;
  do {
     cout << "\nPlayer" << st.player << ",</pre>
         Please Select Move (1-7):";
     cin >> mov.col;
  } while (!valid movement(st, mov));
  return mov;
movem get pc rand mov(state st)
  movem mov;
  do {
      mov.col=rand()%7+1;
  } while (!valid movement(st, mov));
  return mov;
```

Human and Random Moves

```
movem get human mov(state st) {
  movem mov;
  do {
     cout << "\nPlayer" << st.player << ",</pre>
         Please Select Move (1-7):";
     cin >> mov.col;
  } while (!valid movement(st, mov));
  return mov;
movem get pc rand mov(state st)
  movem mov;
  do {
      mov.col=rand()%7+1;
  } while (!valid movement(st, mov));
  return mov;
```
